

**Environmental Evaluation (EE)  
Approval Form**

**PROJECT INFORMATION**

Project Name: Dallas North Tollway (Phase 4B/5A Extension)

Project Limits: FM 428 to FM 121

Project Description: New location six-lane tollway with three-lane frontage roads

PAL & Justification: PAL 3 – Analysis of Build Alternatives on new location, major amounts of ROW acquisition, public involvement, and strong potential for controversy due to environmental impacts

**PUBLIC INVOLVEMENT**

Stakeholder Meetings Executive Workgroup: 10/23/09, 12/4/09, 1/29/10, 5/21/10  
Technical Workgroup: 10/30/09, 12/11/09, 1/22/10, 5/17/10,  
12/10/10  
Dates

Meetings with Affected Property Owners N/A  
Dates

Public Meetings 3/9/10 (Pilot Point), 3/11/10 (Celina)

## **SECTION 1 – PROJECT DESCRIPTION**

- Project Name
- Project Limits
- Project Length
- Type of Work
- Counties
- Estimated Let Date
- Estimated Cost
- Funding Sources
- Existing Facility
- Proposed Facility
- Land Use
- Need and Purpose
- Traffic Volumes
- Alternatives Analysis
- ROW/Easements and Utilities
- Construction Phasing

## **SECTION 2 – IMPACT ASSESSMENT SUMMARIES**

- Water Resources
  - Waters of the U.S., Including Wetlands
  - Navigable Waterways
  - Water Quality
  - Floodplains
- Biological Resources
  - Vegetation and Wildlife
  - Threatened and Endangered Species
- Cultural Resources
  - Historic-age Resources
  - Archeological Resources
- Physical Environment
  - Air Quality
  - Traffic Noise
  - Hazardous Materials
- Community Impacts
  - Socioeconomics
  - Environmental Justice
  - Indirect Impacts
  - Cumulative Impacts
  - Public Lands
- Other
  - Local Tree Ordinances
  - Airway-Highway Clearance
  - Visual Quality and Aesthetics
- Summary of Impacts

## **SECTION 3 – PERMITS AND MITIGATION**

- Permits
  - Section 404 Permits
  - Section 401 Certifications
  - Section 9 and Section 10 Permits
  - Section 408 Determinations
  - Section 402 TPDES Permits
  - Corridor Development Certificate Permits

- Section 10(a) Permits
  - Marl, Sand, Gravel, Shell, or Mudshell Permits
  - Texas Antiquities Permits

Mitigation

- Waters of the U.S., Including Wetlands
- Storm Water
- Floodplains
- Vegetation and Wildlife
- Historic Resources
- Archeological Resources
- Traffic Noise
- Public Lands

**SECTION 4 – ENVIRONMENTAL COMPLIANCE**

- Waters of the U.S., Including Wetlands
- Storm Water
- Floodplain Development
- Vegetation
- Wildlife / Threatened and Endangered Species
- Cultural Resources
- Hazardous Materials
- Noise Abatement
- Public Lands

**SECTION 5 – AGENCY COORDINATION**

Federal

- U.S. Army Corps of Engineers (USACE)
- U.S. Fish and Wildlife Service (USFWS)
- Federal Emergency Management Agency (FEMA)
- U.S. Environmental Protection Agency (EPA)
- U. S. Coast Guard (USCG)

State

- Texas Commission on Environmental Quality (TCEQ)
- Texas Parks and Wildlife Department (TPWD)
- Texas Historical Commission/State Historic Preservation Officer (THC/SHPO)
- Texas Department of Transportation (TxDOT)

Local

- North Central Texas Council of Governments (NCTCOG)
- City
- County
- Dallas Area Rapid Transit (DART)
- Fort Worth Transportation Authority (The T)
- Denton County Transit Authority

Other

**SECTION 6 – PROJECT AGREEMENTS**

- Interlocal Agreement
- Memorandum of Understanding
- Letter of Intent
- Two-Party Agreement
- Three-Party Agreement
- Multi-Party Agreement

**APPENDICES**

1  
2  
3

**SECTION 1  
PROJECT DESCRIPTION**

Project Name: Dallas North Tollway (Phase 4B/5A Extension)

Project Limits: FM 428 to FM 121

Project Length: 11.9 miles

Type of Work: New location six-lane tollway extension with three-lane frontage roads

Counties: Collin, Denton, and Grayson

Estimated Let Date: 2020 - 2023

Estimated Cost: \$677,819,000 (2011 dollars, Level E estimate including construction, ROW and easements, utilities, and soft costs)

Funding Sources: NTTA System Financing

4

5 **Existing Facility**

6 No portion of the proposed Dallas North Tollway Extension Phase 4B/5A (DNT 4B/5A) has been  
7 completed. However, portions of several two-lane county roads, the majority of which run  
8 parallel to the proposed tollway, are included within the DNT 4B/5A proposed right-of-way  
9 (ROW). These roads include County Road (CR) 9, CR 10 (County Line Road), and Scharff  
10 Road, all of which are gravel roads. The access and capacity of these existing roads would be  
11 absorbed by frontage road lanes (i.e., three lanes in each direction) of the proposed DNT  
12 4B/5A. The amount of existing road ROW within the proposed DNT 4B/5A ROW is 28 acres.

13

14 **Proposed Facility**

15 The proposed DNT 4B/5A facility would extend north from Farm to Market Road (FM) 428 in  
16 Collin County for approximately 11.9 miles to provide connectivity with east-west traffic on  
17 FM 121 in Grayson County (see **Exhibits 1-1** and **1-2**). The tollway would include a combination  
18 of land within Collin and Denton counties (Phase 4B) as well as Grayson County (Phase 5A).  
19 This controlled-access toll road would ultimately have six tolled mainlanes, three lanes in each  
20 direction, and three-lane nontolled northbound and southbound frontage roads. Proposed  
21 typical cross sections are shown in **Exhibit 1-3**, and project design features in plan view are  
22 shown in **Exhibit 1-4**.<sup>1</sup> This facility is proposed as an urban tollway with a design speed of  
23 70 miles per hour.

24

25 In addition to connecting to the cross streets that define the termini for this project, the facility  
26 would connect to other planned north-south tollways. The southern terminus of the proposed

---

<sup>1</sup> Note that existing design plans include cross drainage structures for major cross drainages for areas with contributing watersheds of approximately 50 acres or greater. Final design will include cross drainage pipes and culverts for minor cross drainage features.

1 DNT 4B/5A would connect with the planned DNT Extension Phase 4A, for which two lanes of  
2 the northbound frontage road were completed in 2008. The northern terminus would connect  
3 with a tollway currently under study by the Texas Department of Transportation (TxDOT) and  
4 the Grayson County Regional Mobility Authority, which would ultimately connect to U.S.  
5 Highway (US) 75 in the City of Denison, Texas.

6  
7 **Land Use**

8 Existing land use within the proposed DNT 4B/5A project area is predominantly agricultural and  
9 consists of land which is intensively farmed for forage crops (e.g., corn and sorghum) and  
10 wheat, as well as hay meadows and pastures for livestock. Non-farmed areas include riparian  
11 forests within floodplains and occasional residences associated with farms or ranches.  
12 Photographs of representative sites within the project area are shown in **Exhibit 1-5**. The  
13 proposed DNT 4B/5A is included in the thoroughfare plans for both the City of Celina and the  
14 City of Gunter, and zoning for both municipalities supports its construction. Current development  
15 within the project area is primarily residential with some commercial development near other  
16 major thoroughfares.

17  
18 **Need and Purpose**

19 The proposed DNT 4B/5A is needed to address current and projected increases in  
20 transportation demands and to provide a safe and efficient thoroughfare to deliver goods and  
21 services in the northeastern portion of the Dallas/Fort Worth (DFW) metropolitan area. The  
22 primary purpose of the proposed DNT 4B/5A is to address this need by constructing a facility  
23 that would increase mobility, transportation carrying capacity, and safety in the area in response  
24 to forecasted population and employment growth north of the planned DNT Phase 4A terminus  
25 at FM 428 in Collin County, Texas. Supporting information and more details regarding the  
26 project need and purpose (i.e., population and employment statistics, existing transportation  
27 network information, and traffic projections) are provided in **Sections 1-2 and 1-3 of Appendix**  
28 **1-1**.

29  
30 The primary goal of this Environmental Evaluation (EE) is to allow the NTTA and interested local  
31 government entities to preserve a route and associated ROW and drainage easements for the  
32 future DNT 4B/5A extension. This approach allows all interested parties to coordinate the  
33 eventual phased construction of the proposed facility with regional and municipal transportation  
34 and land use plans, thereby avoiding or minimizing future disruptions to residences or  
35 businesses when the NTTA authorizes construction of the tollway extension.

36  
37 **Traffic Volumes**

38 In considering the design for the proposed DNT 4B/5A, estimates for traffic volumes were  
39 obtained and are summarized in **Table 1-1** for selected segments of the proposed DNT 4B/5A.  
40 The average daily traffic (ADT) capacity of a rural freeway with six lanes (three lanes in each  
41 direction) as referenced by the North Central Texas Council of Governments' (NCTCOG)  
42 Metropolitan Transportation Plan (MTP)<sup>2</sup> ranges from 73,000 to 110,000 vehicles per day (vpd).

---

<sup>2</sup> *Mobility 2030 – 2009 Amendment*, Exhibit 17-4: System Warrants; see  
<http://www.nctcog.org/trans/mtp/2030/2009Amendment.asp>.

1 All of the proposed DNT 4B/5A mainlanes are projected to be under capacity. Additional  
2 detailed information regarding a 2010 traffic volume study is included in **Appendix 1-2**.

3  
4 **Table 1-1. DNT 4B/5A Projected Traffic Volume Summary**

Mainlane Segment	Estimated ADT for 2030 (vpd)	
	Northbound	Southbound
FM 428 to FM 455	10,600	10,600
FM 455 to CR 60	4,800	4,800
CR 60 to FM 121	2,700	2,700
<b>SOURCE:</b> Traffic Study for DNT 4B/5A (Wilbur Smith Associates, Inc., September, 2010); see Appendix 1-2.		

6  
7 **Alternatives Analysis**

8 The development of alternatives for the future extension of the DNT into Grayson County has  
9 been underway for over a decade. Multiple DNT 4B/5A alternative alignments were developed  
10 in the initial corridor studies for Collin County and Grayson counties in 2000 (see detailed  
11 discussion of these studies in **Appendix 1-1**). One of those alignments, which follows the  
12 Collin/Denton county line throughout most of its length, was approved in January 2005 in  
13 resolutions adopted by both Collin County and Denton County commissioners courts.  
14 Subsequently in 2008 and 2009, this county line alignment was adopted in similar resolutions by  
15 the cities of Gunter and Pilot Point and by the Grayson County Commissioners Court. In 2008,  
16 however, Collin County rescinded its resolution endorsing the county line alignment as its  
17 preferred route. A copy of these county and city resolutions pertaining to the proposed DNT  
18 4B/5A alignment are included in **Appendix 5-2**.

19  
20 The NTTA has worked with county and city elected officials and their staffs, as well as the  
21 public, in the development and evaluation of various alignment alternatives. In stakeholder  
22 meetings held from October 2009 to May 2010, the NTTA met with civic leaders and staff to  
23 report on the progress of adapting the proposed DNT 4B/5A design to meet local needs and to  
24 receive recommendations from stakeholders. This process resulted in the identification of three  
25 conceptual Build Alternatives for the proposed facility (**Table 1-2** and **Appendix 1-1, Figure**  
26 **2-1**). Two public meetings were held on March 9 and March 11, 2010 to provide information to  
27 members of the community and receive community/stakeholder feedback via the comment  
28 process regarding the proposed Build Alternatives.

29  
30 **Table 1-2. DNT 4B/5A Conceptual Build Alternatives**

Build Alternative	Description
Green (West)	Travels northwest to Pilot Point; connects to US 377
Yellow-Red (Middle)	Southern portion follows Collin/Denton county line; connects to FM 121
Orange-Red (East)	Southern portion is all within Collin County; connects to FM 121

31  
32  
33 All aspects of this study were facilitated by initially preparing digital constraints maps of natural  
34 resources and man-made features (see **Exhibits 1-6** and **1-7**) that both guided the routing of  
35 alternative tollway alignments and served as the basis for comparing and evaluating the

1 alternatives. These constraints maps were used by project stakeholders in developing the Build  
2 Alternatives that were evaluated, in addition to the No-Build Alternative. An evaluation matrix  
3 was utilized to compare the specific design characteristics and estimated costs associated with  
4 each alternative, as well as socioeconomic impacts, environmental impacts, level of stakeholder  
5 and community support, and compatibility with existing regional transportation planning. In  
6 addition to the above major evaluation factors, conceptual level traffic projections for the  
7 alternatives were analyzed but found to be comparable for all Build Alternatives based on  
8 available data. The alternatives analysis indicated all proposed Build Alternatives would likely  
9 result in commercial development along frontage roads, yielding potential economic benefits  
10 including new jobs and a general increase in community commerce, real estate values, and tax  
11 revenues. A copy of the Conceptual Alternatives Evaluation Report for the proposed DNT 4B/5A  
12 is included as **Appendix 1-1**.

13  
14 After further briefings by staff and local government stakeholders, the NTTA Board approved a  
15 resolution July 21, 2010, to move forward with the schematic design and environmental  
16 evaluation of the Yellow-Red (Middle) or county line alignment Build Alternative (**Appendix 1-1,**  
17 **Page 2**). Final selection of a preferred alternative by the NTTA Board will occur after the  
18 engineering and environmental studies have been finalized; all stakeholder and public  
19 comments have been evaluated; and feasibility studies have been concluded.

#### 20 21 **ROW/Easements and Utilities**

22 Approximately 583.5 acres of ROW and 33.9 acres of drainage easements would be required to  
23 construct the proposed DNT 4B/5A. This includes approximately 28 acres of existing road  
24 ROW, which would not need to be acquired. The remaining 589.4 acres of combined ROW and  
25 easements would be acquired from 17 different land owners along the proposed Build  
26 Alternative alignment (see **Exhibit 1-4**, and **Appendix 1-1, Pages 87-90**). The proposed DNT  
27 4B/5A would have a typical ROW width of 400 feet, would not require any displacements of  
28 commercial or residential structures, and would not affect any public land or facilities other than  
29 existing public roads.

30  
31 Utilities such as water lines, sewer lines, gas lines, telephone and fiber optic cables, electrical  
32 lines, and other subterranean and aerial utilities may require minor adjustments as a result of  
33 the proposed DNT 4B/5A. Other than potential temporary interruptions in service, no adverse  
34 impacts (i.e., termination of service or long-term interruptions) to utilities, such as electrical, gas,  
35 phone, water, or sewer are expected to occur from the construction of the proposed DNT 4B/5A.  
36 Schedules for any utility adjustments would be closely coordinated to minimize disruptions and  
37 inconvenience to the utility customers.

#### 38 39 **Construction Phasing**

40 Construction of the frontage roads for the proposed DNT 4B/5A would occur first, followed by  
41 the mainlanes. Detailed plans for construction phasing have not been developed to date.  
42 However, as the proposed DNT 4B/5A is on new location, detours and complex construction  
43 sequencing are not anticipated.

## Index

### to Plan View Design Maps (Pages 2 – 13)

The purple frames in the map index outline areas covered by individual maps in Pages 2 – 13 of this exhibit.

The proposed right-of-way (ROW) is shown in orange.

Major streams and lakes/ponds (blue), property boundaries (gray), and major road names are also shown for reference.

The index diagram is not to scale.

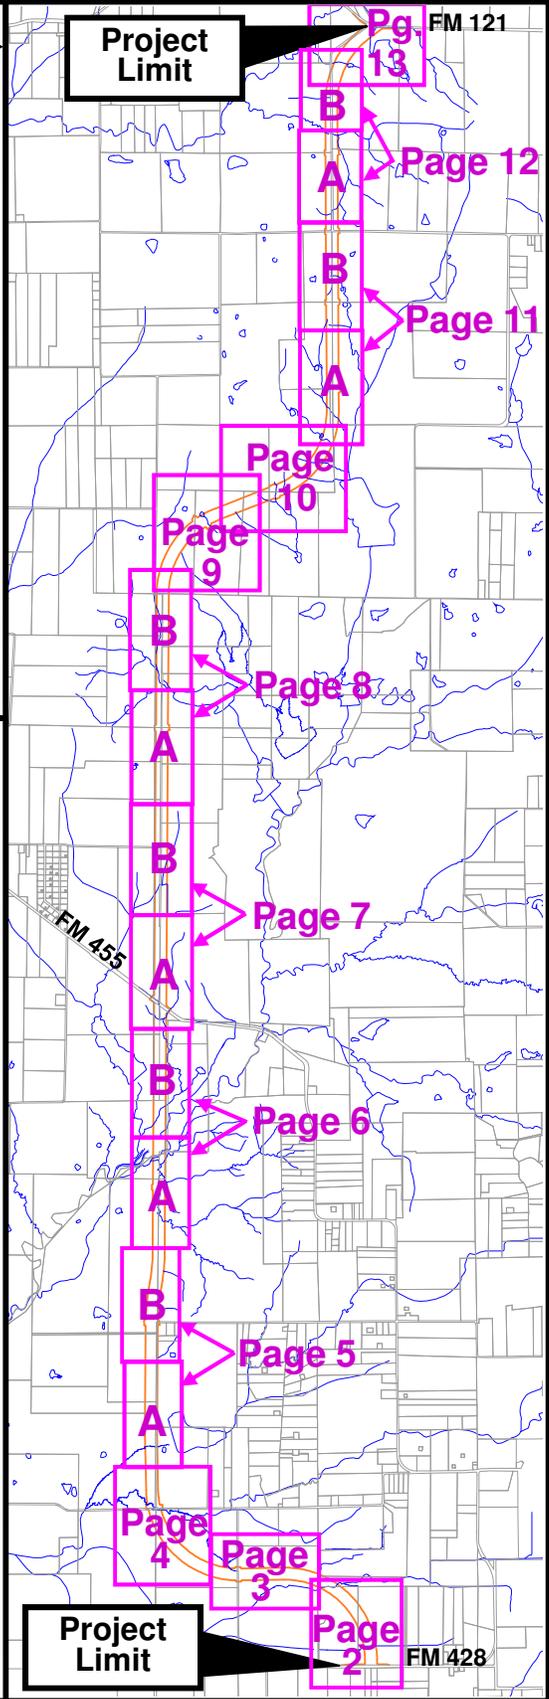

**Notes:** The design maps on pages 2 – 13 of this exhibit show only the main proposed design features; please see project schematic for design details.

<b>Total</b>				<b>5.28 acres 19,345 feet</b>	<b>0.30 acre</b>

1. OHWM – Ordinary High Water Mark.

2. Locations of wetland data points are provided in Appendix 2-1, Figure 3.

3

As shown in **Table 2-1**, anticipated impacts to jurisdictional streams or stream remnants, including wetlands, would include permanent impacts to approximately 5.28 acres (19,345 linear feet) of open water and 0.30 acre of wetlands. There would be no temporary impacts. Waters of the U.S. beyond the proposed ROW and drainage easements were not included in the calculations of impacts, as no impacts are expected. The permanent impacts would include culvert placement, fill, bridge column installation, and stream grading activities.

**Navigable Waterways**

There are no navigable waterways within the proposed DNT 4B/5A project area.

**Water Quality**

**Storm Water**

As the proposed DNT 4B/5A will disturb more than 5 acres of land, the NTTA is required to comply with the Texas Commission on Environmental Quality (TCEQ) permit requirements discussed in Section 3 of this EE. No permanent water quality impacts are expected as a result of the proposed DNT 4B/5A.

**Impaired Waters**

According to recent water quality reports maintained by the TCEQ,<sup>4</sup> none of the aquatic features crossed by the proposed DNT 4B/5A are designated as either threatened or impaired and the proposed DNT 4B/5A is not within 5 miles upstream of a threatened or impaired water segment.

**Floodplains**

Digital Flood Insurance Rate Maps (FIRM) depicting 100-year floodplains in Collin, Denton, and Grayson counties were obtained from the FEMA<sup>5</sup> and examined for the proposed DNT 4B/5A project area. All three counties within the project area participate in the National Flood Insurance Program. The floodplains intersected by the proposed DNT 4B/5A ROW are shown in **Exhibit 2-2**. The proposed DNT 4B/5A ROW crosses approximately 71.76 acres of established 100-year floodplains at the five locations shown in **Table 2-2**.

**Table 2-2. Project ROW Included within Floodplains**

Water Feature Associated with the FEMA 100-Year Floodplain	General Location of Floodplain Crossing by DNT 4B/5A	ROW Included within Floodplain
Three unnamed tributaries to Little Elm Creek	Near the intersection of CR 8/CR 9	19.86 acres
Little Elm Creek	0.5 mile south of FM 455	44.58 acres
Unnamed tributary to Walnut Fork	0.5 mile south of Marilee Road (CR 60)	3.10 acres
Two unnamed tributaries to Walnut Fork	1 mile north of Marilee Road (CR 60)	1.05 acres
Unnamed tributary to Buck Creek	0.75 mile south of FM 121	3.17 acres
<b>Total ROW within Floodplain</b>		<b>71.76 acres</b>

<sup>4</sup> 2008 Texas Water Quality Inventory and 303(d) List (approved July 2008) and Draft 2010 Texas Integrated Report for Clean Water Act Sections 305(b) and 303(d) (pending approval) (see TCEQ Web site, [http://www.tceq.state.tx.us/compliance/monitoring/water/quality/data/wqm/305\\_303.html](http://www.tceq.state.tx.us/compliance/monitoring/water/quality/data/wqm/305_303.html)).

<sup>5</sup> Digital floodplain data were downloaded from the Map Service Center on the FEMA Web site: <http://msc.fema.gov>. The data shown in Exhibit 2-2 correspond with the 100-year floodplain boundaries reflected in the following FEMA FIRMs: 48085C015J, June 2, 2009; 48121C0150E, April 2, 1997; 48121C0280E, April 2, 1997; and 48181C0500F, September 29, 2010. The floodplain mapping studies were published in the following years for the three counties affected by the proposed project: Collin County, 2009; Denton County, 2002; and Grayson County, 2010.

1 The hydraulic design for the proposed DNT 4B/5A will be in accordance with current NTTA  
2 design policies and procedures. The proposed DNT 4B/5A would permit the conveyance of the  
3 design year flood without causing substantial<sup>6</sup> damage to the tollway, stream, or other property.  
4 Drainage easements associated with three bridge crossings of floodplains have been included  
5 in the DNT 4B/5A schematic design to mitigate the effects of placing bridge abutments within  
6 floodplains. Areas within the floodplain from upstream to downstream of these bridges will be  
7 modified to ensure bridge construction does not substantially affect flood water surface  
8 elevations. The proposed DNT 4B/5A will not increase the base flood elevation to a level that  
9 would violate applicable floodplain regulations or ordinances. Furthermore, in cooperation with  
10 the FEMA, the NTTA will conform to the standard for temporary and permanent fill set by the  
11 FIRMs.

## 14 **Biological Resources**

### 16 **Vegetation and Wildlife**

17 The DNT 4B/5A corridor is located within the Blackland Prairie natural region of Texas, which is  
18 characterized by generally deep and fertile dark clay soils. This ecoregion once supported  
19 predominantly tallgrass prairie communities that were protected from forest encroachment by  
20 occasional wildfires. The plant communities formed a mosaic of open prairie with densely  
21 wooded riparian areas along the creeks and streams within the region. According to the Texas  
22 Parks and Wildlife Department (TPWD) statewide vegetation map,<sup>7</sup> the southern half of the  
23 project corridor is located in the "Crops" physiognomic region, and the northern half of the  
24 corridor is designated as "Other Native or Introduced Grasses." Plants commonly associated  
25 with the "Crops" vegetation type include cultivated cover crops or row crops providing food  
26 and/or fiber for either man or domestic animals. The "Other Native or Introduced Grasses" land  
27 cover category represents areas that may have once become forested but which were cleared  
28 of woody vegetation.

29  
30 Several field reconnaissance visits during October 2010 verified that the existing vegetation  
31 within the proposed DNT 4B/5A project area is consistent with the TPWD description above.  
32 Nearly all land throughout the project corridor is used for agricultural purposes and is divided in  
33 roughly equivalent amounts of either cropland or pastures and hay meadows. Cropland areas  
34 are plowed annually for the production of grain sorghum (*Sorghum* sp.), corn (*Zea mays*), and  
35 wheat (*Triticum* sp.). Pastures for livestock and hay meadows vary widely in terms of species  
36 composition and range condition, but the most common species found in these areas are non-  
37 native grasses such as Bermuda grass (*Cynodon dactylon*), King Ranch bluestem (*Bothriochloa*  
38 *ischaemum*), and Johnson grass (*Sorghum halepense*). Native prairie grasses (**Exhibit 1-5,**  
39 **Photo 12**) occur occasionally throughout the project area but are rarely dominant plants within  
40 the landscape. Woodlands within the project corridor are generally riparian forests (**Exhibit 1-5,**  
41 **Photos 7 and 9**) associated with the larger stream crossings of the proposed ROW. Upland

---

<sup>6</sup> In this context, "substantial" refers to damage beyond what would be considered minor. As applied to the tollway, for example, minor damage would not place any of the facility's mainlanes, ramps, bridges, or frontage roads out of service to effect repairs. At this stage of the design process, precise design characteristics tailored to specific site conditions have not been developed but will be part of the final design for the proposed DNT 4B/5A.

<sup>7</sup> *The Vegetation Types of Texas* map published by TPWD (1984).

1 woodlands are rarely found within the project area and are limited to either fencerows or  
2 mesquite trees (*Prosopis glandulosa*) which often invade pastures and are an indicator of  
3 previous heavy grazing by livestock.

4  
5 Based on wildlife sightings and evidence of wildlife (e.g., animal scat and tracks) observed  
6 during field surveys, the proposed DNT 4B/5A project area provides habitat to a variety of  
7 animals common to the region. A variety of songbirds occur within the area, and observations of  
8 other bird species included barred owl (*Strix varia*), turkey vulture (*Cathartes aura*), great blue  
9 heron (*Ardea herodias*), and woodpeckers (*Melanerpes* sp. and *Picoides* sp.). Evidence of  
10 armadillo (*Dasypus novemcinctus*), bobcat (*Lynx rufus*), coyote (*Canis latrans*), raccoon  
11 (*Procyon lotor*), white-tailed deer (*Odocoileus virginianus*), and eastern cottontail rabbit  
12 (*Sylvilagus floridanus*) were observed. Evidence of ground disturbance associated with feral  
13 hogs (*Sus scrofa*) was observed in many of the riparian areas.

14  
15 The proposed DNT 4B/5A is expected to have an overall footprint of approximately  
16 617.40 acres representing all ROW (583.52 acres) and drainage easements (33.88 acres).  
17 Temporary ground disturbance would affect all areas within the DNT 4B/5A footprint during road  
18 construction, which includes 15.10 acres of existing roads (paved and gravel surface) and  
19 602.30 acres of vegetated or water surfaces. Permanent impacts would result from the creation  
20 of 326.27 acres of new paved surfaces within the DNT 4B/5A footprint. Areas of temporary  
21 impacts to vegetation (276.03 acres) that are not ultimately paved will be revegetated with  
22 grass-dominated ground cover maintained by periodic mowing (i.e. "maintained grass").

23  
24 The construction-related conversion of existing vegetation to either paved surfaces or  
25 maintained grass is expected to affect 548.53 acres of combined cropland and pastures within  
26 the construction footprint of the proposed DNT 4B/5A. Impacts would also occur to 53.77 acres  
27 of vegetation and water features with particular importance as wildlife habitat. The inventory of  
28 habitat types described in **Appendix 2-3** follows the guidelines established by the TPWD<sup>8</sup> for  
29 assessing and mitigating impacts to wildlife habitat for transportation projects and includes the  
30 following habitat within the ROW: riparian forest (44.86 acres); upland forest (4.49 acres);  
31 fencerow trees (3.39 acres); several unusually large trees within riparian and fencerow areas;  
32 non-jurisdictional stock ponds (0.62 acre); and several small remnant patches of high-quality  
33 native tallgrass prairie (0.41 acre) dominated by big bluestem (*Andropogon gerardii*) and Texas  
34 cupgrass (*Eriochloa sericea*). The location and acreage of these areas of proposed vegetation  
35 impacts are shown in **Exhibit 2-3**, and details regarding proposed forest impacts are provided in  
36 Woodlands Data Forms in **Appendix 2-4**. Proposed impacts to habitat associated with major  
37 water features occur within the areas mapped as riparian forest and were discussed above  
38 under the heading of **Waters of the U.S., Including Wetlands**.

39  
40 Based on the above mentioned impacts to habitat and vegetation, construction of the proposed  
41 DNT 4B/5A is expected to affect approximately 4,510 trees greater than 6 inches diameter at  
42 breast height (dbh) occurring on 52.74 acres of combined riparian forest, upland forest, and  
43 fencerows. Impacts to forested areas are unavoidable in light of the design constraints for

---

<sup>8</sup> TxDOT-TPWD Memorandum of Agreement for the Finalization of the 1998 Memorandum of Understanding Concerning Habitat Descriptions and Mitigation (2001).

1 constructing a six-lane tollway with frontage roads and ramps along the proposed Build  
2 Alternative alignment. Similarly, impacts to the habitat represented by water features and  
3 remnant tallgrass prairie areas are unavoidable for the same reason.

4  
5 In accordance with the TPWD guidelines for TxDOT transportation projects cited previously, the  
6 NTTA has considered mitigation for the expected losses to habitat as described. The proposed  
7 DNT 4B/5A will not affect habitat for federal candidate threatened or endangered species or any  
8 rare vegetation series that is habitat for a state-listed species. The proposed DNT 4B/5A will  
9 also not affect any S1 or S2 listed vegetation communities. Thus, the habitats for which the  
10 TPWD generally requires compensatory mitigation are not affected. However, as TPWD  
11 guidelines require consideration of compensatory mitigation for impacts to bottomland  
12 hardwoods, native prairies, and riparian sites, the need for compensatory mitigation for the loss  
13 of riparian forest habitat and native prairie remnant areas will be coordinated with the TPWD.  
14 The amount and quality of upland forest, fencerow, and stock pond habitat are not sufficient to  
15 warrant mitigation, particularly in light of the relative abundance of these types of features  
16 throughout the proposed DNT 4B/5A project area.

17  
18 During project development, the NTTA will design, use, and promote construction practices that  
19 minimize adverse effects on both regulated and unregulated wildlife habitat. Existing vegetation,  
20 especially native trees, will be avoided and preserved wherever practicable. Every effort will be  
21 made to preserve trees within the ROW and other areas where they neither compromise safety  
22 nor substantially interfere with construction of the proposed DNT 4B/5A.

### 23 24 ***Migratory Birds***

25 The Migratory Bird Treaty Act (MBTA) states that it is unlawful to kill, capture, collect, possess,  
26 buy, sell, trade, or transport any migratory bird, nest, young, feather, or egg in part or in whole,  
27 without a federal permit issued in accordance with the MBTA's policies and regulations.  
28 Migration patterns would not likely be affected by the proposed DNT 4B/5A. However, as  
29 riparian habitat and creeks are affected by the proposed DNT 4B/5A, a survey of these areas  
30 will be conducted prior to any construction, demolition, or clearing activities (as stated in Section  
31 4 of this EE) to verify if any migratory birds are found within the proposed DNT 4B/5A project  
32 area.

### 33 34 **Threatened and Endangered Species**

35 The presence or absence of state-listed threatened and endangered species was researched  
36 via the TPWD Web site. The potential presence of federally listed species was also checked  
37 with Internet information maintained by the USFWS. In addition, a database search was  
38 conducted using the TPWD Texas Natural Diversity Database (TXNDD, see **Appendix 5-1**).  
39 The TPWD maintains the TXNDD to track known occurrences of special species on public land  
40 throughout Texas. The TPWD and USFWS Web sites listed several threatened or endangered  
41 species that may occur within Collin, Denton, and Grayson counties. The listed status and  
42 anticipated impacts to each of these species are included in **Appendix 2-5**.

43  
44 The timber/canebrake rattlesnake, listed as threatened by the TPWD, is the only species that  
45 may potentially possess habitat within the proposed DNT 4B/5A project area. Preferred habitat  
46 for the timber/canebrake rattlesnake exists within forested areas with dense ground cover. The

1 distribution of the timber/canebrake rattlesnake stretches from the East Coast westward into  
2 Texas and as far north as New England. In the southern portions of its range, this species  
3 prefers to make its den in somewhat swampy, wetland habitats. The DFW Metroplex represents  
4 the far western edge of its range and is characterized by drier conditions than generally  
5 preferred for this species. Populations tend to be higher in eastern Texas where greater  
6 concentrations of wetlands and humid forests are found. Forested areas located near  
7 permanent water sources are also utilized as fallen debris from trees can act as refugia for the  
8 rattlesnake. The timber/canebrake rattlesnake is a shy animal that prefers to live in areas with  
9 high amounts of cover and available refuge. This type of habitat is the most likely within the  
10 DFW Metroplex to be suitable for this species. In addition, the home range of this species is  
11 large, at times encompassing in excess of 100 acres. Within the proposed DNT 4B/5A project  
12 area, possible habitat includes forested areas within the floodplain for Little Elm Creek. The  
13 proposed DNT 4B/5A is not likely to adversely affect this species because the amount of  
14 affected habitat (nearly 45 acres) is a small portion of the rattlesnake's range, and there is a  
15 general lack of preferred brushy habitat within the project area. To ensure a minimization of  
16 effects, the forested habitat near Little Elm Creek and its tributaries will be surveyed for signs of  
17 this species prior to construction activities.

18  
19 No federally-listed or state-listed threatened or endangered species would be adversely affected  
20 by the proposed DNT 4B/5A. During project development, the NTTA would design, use, and  
21 promote construction practices that minimize adverse effects on both regulated and unregulated  
22 wildlife habitat. Existing vegetation, especially native trees, will be avoided and preserved  
23 wherever practicable.

## 24 25 26 **Cultural Resources**

### 27 28 **Historic-age Resources**

29 A reconnaissance survey of non-archeological historic-age resources was conducted for the  
30 proposed DNT 4B/5A. The area of potential effects (APE) was defined as 300 feet beyond the  
31 proposed ROW for this survey.

32  
33 The Secretary of the Interior's Guidelines for National Register of Historic Places (NRHP)  
34 eligibility requires the consideration of 50-year old properties for inclusion in the NRHP.  
35 However, a 45-year cutoff (45 years prior to the estimated let date) is suggested to allow for  
36 unforeseen delays in construction contract letting. Although a projected let date for the proposed  
37 DNT 4B/5A has not been established, the year 2023 was assumed for purposes of establishing  
38 a historic-age limit. Thus, 1978 was the cutoff date used for determining which resources meet  
39 the historic-age criteria.

40  
41 A review of the NRHP, the list of State Archeological Landmarks, and the list of Recorded Texas  
42 Historic Landmarks indicates that no historically significant resources have been previously  
43 documented within the project APE. A field survey revealed 30 historic-age resources (built prior  
44 to 1978) located on eight different farmsteads within the project APE. The survey concluded that  
45 none of the historic-age resources should be recommended to be NRHP-eligible. Furthermore,  
46 there are no Official Texas Historical Markers within the project APE.

1 Because no properties within the APE and/or ROW are recommended as NRHP-eligible, the  
2 proposed DNT 4B/5A would have no effect to historic resources. The complete historic-age  
3 resources due diligence report for the proposed DNT 4B/5A is provided as **Appendix 2-6**.

#### 4 5 **Archeological Resources**

6 The NTTA conducted an archeological evaluation of archival records relevant to the project  
7 corridor area in September 2010 (**Appendix 2-7**). The evaluation included a windshield survey  
8 and did not involve on-the-ground field inspections. No prehistoric or historic sites were  
9 previously recorded within the APE, which extended 100 feet beyond the ROW (i.e., total width  
10 of 600 feet) for this survey.

11  
12 The archeological evaluation examined the proposed DNT 4B/5A project area for areas with  
13 high probability for containing archeological resources. This assessment was based on site  
14 patterning derived from the findings of previous investigations, the assessment of historic  
15 settlement along the proposed DNT 4B/5A corridor, and field observations. Based on this  
16 information, the archeological evaluation recommended trenching in the floodplain of Little Elm  
17 Creek to determine if buried site deposits are present. In addition, it recommended a pedestrian  
18 survey and shovel testing for upland edges and terraces of Little Elm Creek, as well as areas  
19 where the proposed DNT 4B/5A ROW crosses or parallels historic roads. This report was  
20 submitted to the Texas Historical Commission (THC) in September 2010 for coordination  
21 regarding the recommendations for further survey work.

22  
23 After reviewing the archeological evaluation, the THC recommended on October 28, 2010 (see  
24 **Appendix 5-1**) that a pedestrian survey to be performed for the entire DNT 4B/5A corridor. The  
25 THC has issued a Texas Antiquities Permit (TAP) (**Appendix 5-1**) for a pedestrian survey of the  
26 proposed DNT 4B/5A project area which was completed during February through April 2011  
27 (**Appendix 2-8**).

28  
29 The research design for the archeological survey identified areas of highest potential for  
30 prehistoric and historic archeological resources. The Little Elm Creek floodplain was considered  
31 the area with the greatest likelihood of encountering prehistoric resources, in addition to the  
32 terraces of smaller stream channels. A review of historic maps of the project area indicated that  
33 historic resources would most likely be encountered on hill tops, ridges, or knolls overlooking  
34 the surrounding landscape and near historic roads. Field teams surveyed the entire proposed  
35 DNT 4B/5A ROW and drainage easements, and performed shovel testing throughout. Soil  
36 removed during shovel testing was examined for cultural materials, which were photographed  
37 and described. Backhoe trenching at four locations within the Little Elm Creek floodplain was  
38 also completed, the results of which are discussed in **Appendix 2-8**.

39  
40 A total of 73 shovel tests were completed during the archeological survey. No prehistoric  
41 resources were found within the shovel tests or on the ground surface, yet four historic sites  
42 were recorded (41DN577, 41DN578, 41DN579, 41GS221). Two of the four historic sites appear  
43 to represent abandoned farmsteads that were occupied from approximately the 1880s to as late  
44 as the 1960s. A third site has a concrete trough most likely in use during the first half of the 20<sup>th</sup>  
45 century, and the fourth site reflects historic trash scatter from the same time period. None of the  
46 historic sites is recommended as eligible for listing on the NRHP.

1 In addition to extensive shovel testing of the area within and adjacent to the Little Elm Creek  
2 floodplain, backhoe trenching was also performed. Four trenches were excavated to a depth of  
3 3 meters (9.8 feet) to explore for buried sites near the present drainage channel, to look for sites  
4 associated with an older channel farther north, and to test the upland edge for occupation.  
5 These deep testing efforts did not uncover any prehistoric archeological sites.

6  
7 Two aspects of the area where the proposed DNT 4B/5A would cross the Little Elm Creek  
8 floodplain may account for the lack of prehistoric resources in this high potential area. First, this  
9 area is in an upland setting relative to areas farther downstream. Previous investigations south  
10 of the proposed DNT 4B/5A project area, particularly the Lewisville Lake studies, recorded  
11 numerous prehistoric sites adjacent to Little Elm Creek. This high density area falls within the  
12 East Cross Timbers, the higher biotic diversity of which may have served as a significant draw  
13 for more intensive use and occupation. Second, soil characteristics observed in the profiles of  
14 floodplain trenches indicate a history marked by intermittent aggradation and degradation. This  
15 phenomenon of both deposition and erosion of floodplain soils would create a situation that  
16 would be less ideal for site preservation when compared to more actively and reliably aggrading  
17 settings.

18  
19 Investigations performed during both the archival research and field survey have contributed  
20 more information to the understanding of historic settlement in Collin, Denton, and Grayson  
21 counties. In all four of the historic sites documented in the archeological survey report, the lack  
22 of site integrity is a principal basis for the recommendation that further investigations of these  
23 sites are unwarranted. In addition, extensive exploration for prehistoric sites found none to exist  
24 within the proposed DNT 4B/5A project area, and the archeological survey report included a  
25 recommendation that further investigations for prehistoric archeological sites are unnecessary.

## 26 27 28 **Physical Environment**

### 29 30 **Air Quality**

31 The southern portion of the proposed DNT 4B/5A is located in Collin and Denton counties,  
32 which are within the Environmental Protection Agency's (EPA) designated nine-county serious  
33 nonattainment area for the 8-hour standard for the pollutant ozone (O<sub>3</sub>); therefore, the  
34 transportation conformity rule applies to this portion of the proposed DNT 4B/5A project area.  
35 The northern portion of the proposed DNT 4B/5A is in Grayson County, which has been  
36 designated by the EPA as exhibiting attainment of National Ambient Air Quality Standards  
37 (NAAQS) for all criteria pollutants under the Clean Air Act. The proposed DNT 4B/5A is included  
38 in the financially constrained *Mobility 2030 – 2009 Amendment* consisting of highway segments  
39 FT1 1900 and FT1 1910. The MTP received a favorable air quality conformity determination by  
40 the U.S. Department of Transportation in August 2009. The proposed DNT 4B/5A is not listed in  
41 the 2011-2014 Transportation Improvement Program (TIP) for the DFW area because the  
42 proposed construction is not within the 4-year planning horizon for the TIP. Once a letting date  
43 is scheduled, the NTTA will coordinate with the NCTCOG to include the proposed DNT 4B/5A in  
44 the appropriate TIP. Project MTP pages depicting the proposed DNT 4B/5A are included in

45 **Appendix 2-9.**

**Traffic Air Quality Analysis**

The primary pollutants from motor vehicles are volatile organic compounds (VOC), carbon monoxide (CO), and nitrogen oxides (NO<sub>x</sub>). VOC and NO<sub>x</sub> can combine under the right conditions in a series of photochemical reactions to form O<sub>3</sub>. Because these reactions take place over a period of several hours, maximum concentrations of O<sub>3</sub> are often found far downwind of the precursor sources. Thus, O<sub>3</sub> is a regional problem and not a localized condition.

The modeling procedures of O<sub>3</sub> require long term meteorological data and detailed area wide emission rates for all potential sources (industry, business, and transportation) and are normally too complex to be performed within the scope of an environmental analysis for a highway project. Accordingly, concentrations of O<sub>3</sub> for the purpose of comparing the results of the NAAQS are modeled by the regional air quality planning agency for the State Implementation Plan. However, concentrations for CO are readily modeled for highway projects and are required by federal regulations.

Topography and meteorology of the area in which the proposed DNT 4B/5A is located would not seriously restrict dispersion of the air pollutants. The interim year 2025 ADT is estimated to be 12,600 vpd and the design year 2030 ADT is estimated to be 21,200 vpd. CO concentrations for the proposed DNT 4B/5A were modeled using CALINE3 and MOBILE6.2 and factoring in adverse meteorological conditions and sensitive receptors at the ROW line in accordance with the TxDOT 2006 *Air Quality Guidelines*. Although the projected ADT for the proposed DNT 4B/5A would not exceed the 140,000 vpd threshold identified by TxDOT as the requirement for a traffic air quality analysis (TAQA), a TAQA was conducted in order to maintain a consistent approach to the air quality analyses. As it was determined that a quantitative mobile source air toxics analysis was appropriate because the proposed DNT 4B/5A is a new location six-lane tollway, conducting a TAQA is consistent with this approach. Local concentrations of CO are not expected to exceed national standards at any time. The results of the analysis are summarized in **Table 2-3**.

**Table 2-3. Traffic Air Quality Analysis Results**

Year	Traffic Volume <sup>1</sup>		Emission Factor (g/mile) <sup>2</sup>	CO Concentration <sup>3</sup> (ppm)		% NAAQS <sup>4</sup>	
	ADT (vpd)	DHV (vpd)		One-Hour	Eight-Hour	One-Hour	Eight-Hour
2025	12,600	1,147	5.54	3.9	2.42	11.1%	26.9%
2030	21,200	1,929	5.49	4.0	2.48	11.4%	27.6%

1. Traffic data used in the analysis was prepared by Wilbur Smith Associates. DHV is design hourly volume of traffic.  
 2. Emission factor applies at a speed of 65 mph for general purpose and managed lanes, and at a speed of 45 mph for frontage roads; g/mile = grams per mile.  
 3. Includes an ambient concentration of 3.7 ppm for the one-hour averaging time and 2.3 ppm for the 8-hour averaging time; ppm = parts per million.  
 4. Data is relative to the one-hour NAAQS of 35 ppm and the 8-hour NAAQS of 9 ppm.

1 **Congestion Management Process**

2 The congestion management process (CMP) is a systematic process for managing congestion  
3 that provides information on transportation system performance and on alternative strategies for  
4 alleviating congestion and enhancing the mobility of persons and goods to levels that meet state  
5 and local needs. The proposed DNT 4B/5A was developed from the NCTCOG's operational  
6 CMP which meets all requirements of amended 23 U.S. Code (USC) Section 134(k)(3) and  
7 49 USC 5303(k)(3), amendments incorporating the transportation planning requirements of the  
8 Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users. Information  
9 regarding the CMP is found in **Appendix 2-10**.

10  
11 **Mobile Source Air Toxics Analysis**

12 In addition to the criteria air pollutants for which there are NAAQS, the EPA also regulates air  
13 toxics. Most air toxics originate from human-made sources, including on-road mobile sources,  
14 non-road mobile sources (e.g., airplanes), area sources (e.g., dry cleaners), and stationary  
15 sources (e.g., factories or refineries).

16  
17 Mobile source air toxics (MSAT) are a subset of the 188 air toxics defined by the CAA. The  
18 MSAT are compounds emitted from highway vehicles and non-road equipment. Some toxic  
19 compounds are present in fuel and are emitted to the air when the fuel evaporates or passes  
20 through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels  
21 or as secondary combustion products. Metal air toxics also result from engine wear or from  
22 impurities in oil or gasoline.

23  
24 A quantitative MSAT analysis was conducted for the proposed DNT 4B/5A. The analysis  
25 indicates a decrease in MSAT emissions can be expected for both the Build and No-Build  
26 Alternatives for the interim year 2025 and design year 2030, as compared with the 2009 base  
27 year. Emissions of total MSAT are predicted to decrease by 56% in 2030 compared with 2009  
28 levels for the Build Alternative. If emissions are plotted over time, a decreasing level of MSAT  
29 emissions can be seen even though overall vehicle miles traveled (VMT) continues to rise. The  
30 projected decrease in MSAT emissions, despite expected increases in VMT, is attributable to  
31 decreases in MSAT expected from a variety of EPA air pollution control programs. A discussion  
32 of EPA programs targeting MSAT and the complete quantitative MSAT analysis is included in  
33 **Appendix 2-10**.

34  
35 The examination of MSAT included consideration of areas with human populations that may be  
36 particularly vulnerable to a reduction in ambient air quality. These "sensitive receptors" include  
37 public facilities most likely to contain large concentrations of the more sensitive population (e.g.,  
38 hospitals, schools, licensed daycare facilities, and elder care facilities). Research has shown  
39 that MSAT pollutant levels drop off substantially as the distance from the roadway increases.  
40 Dispersion studies have shown within 1,640 feet (500 meters) from the DNT 4B/5A, it is very  
41 difficult to distinguish the roadway emissions from background air toxic levels in any given area.  
42 No sensitive receptors were identified within 1,640 feet (500 meters) from the proposed DNT  
43 4B/5A.

44  
45 During the construction phase of the proposed DNT 4B/5A, there could be temporary increases  
46 in air pollutant emissions from construction activities, equipment, and related vehicles. The

1 primary construction related emissions are particulate matter (fugitive dust) from site preparation  
2 and construction, and non-road MSAT from construction equipment and vehicles. The primary  
3 MSAT emission related to construction is diesel particulate matter from diesel powered  
4 construction equipment and vehicles.  
5

6 These emissions are temporary in nature (only occurring during actual construction) and it is not  
7 reasonably possible to estimate impacts from these emissions due to the limitations of the  
8 existing models. However, the potential impacts of particulate matter emissions would be  
9 minimized by using fugitive dust control measures such as covering or treating disturbed areas  
10 with dust suppression techniques, sprinkling, covering loaded trucks, and other dust abatement  
11 controls, as appropriate. The MSAT emissions would be minimized by encouraging use of EPA  
12 required cleaner diesel fuels, limits on idling, increasing use of cleaner burning diesel engines,  
13 and other emission limitation techniques, as appropriate.  
14

15 However, considering the temporary and transient nature of construction related emissions as  
16 well as the mitigation actions to be utilized, it is not anticipated that emissions from construction  
17 of the proposed DNT 4B/5A would result in adverse impacts on air quality in the area.  
18

### 19 **Traffic Noise**

20 A traffic noise analysis was conducted for the proposed DNT 4B/5A in accordance with the  
21 Federal Highway Administration (FHWA) approved guidelines for analysis and abatement for  
22 highway traffic noise. Because the DNT 4B/5A is proposed to be a new-location tollway, existing  
23 noise levels were measured using an ANSI S1.4, Type 2 Extech (Model 407780) integrating  
24 sound level meter at representative receivers along the corridor. The FHWA traffic noise  
25 modeling software (TNM 2.5) was used to calculate predicted traffic noise levels at receiver  
26 locations that represent the land use activity areas adjacent to the proposed DNT 4B/5A that  
27 might be affected by traffic noise and potentially benefit from feasible and reasonable noise  
28 abatement. The modeling software primarily considers the following factors: number, type, and  
29 speed of vehicles; highway alignment and grade; cuts, fills, and natural berms; surrounding  
30 terrain features; and the locations of activity areas likely to be affected by the associated traffic  
31 noise.  
32

33 A total of five noise receivers, all single family residential, were identified and modeled within the  
34 proposed DNT 4B/5A project area. Only one of these receivers was sufficiently near the  
35 proposed tollway to be representative of land use activity areas directly adjacent to the  
36 proposed DNT 4B/5A and was carried forward through the traffic noise analysis. **Table 2-4**  
37 summarizes the measured existing noise level and predicted design year noise level at the  
38 representative noise receiver, which indicates the proposed DNT 4B/5A would not result in a  
39 traffic noise impact. **Exhibit 2-3 (Page 14)** identifies the location of this representative noise  
40 receiver. **Appendix 2-11** provides additional details about this traffic noise analysis, including a  
41 discussion of the unit of measurement (i.e., dBA Leq) used for assessing traffic noise impacts  
42 and FHWA Noise Abatement Criteria (NAC) for various types of land uses.  
43  
44  
45  
46

**Table 2-4: Traffic Noise Levels (dBA Leq)**

Representative Receiver	Land Use Category	NAC Level	Existing 2010	Predicted 2030	Change (+/-)	Noise Impact
Noise Receiver (NR)1 – Single Family Residential	B	67	55	58	3	No

Land use activity areas along most of the proposed DNT 4B/5A are currently Category D—undeveloped land. There is no NAC for undeveloped land; however, to avoid noise impacts that may result from future development of properties adjacent to the project, local officials responsible for land use control programs should ensure, to the maximum extent possible, no new activities are planned or constructed along or within the following predicted (2030) noise impact contour:

<u>Land Use</u>	<u>Impact Contour</u>	<u>Distance from ROW</u>
Category B	66 dBA	10 feet

A copy of this traffic noise analysis will be available to local officials to ensure, to the maximum extent possible, future developments are planned, designed, and programmed in a manner that avoids traffic noise impacts. On the date of approval of this document (Date of Public Knowledge), the NTTA is no longer responsible for providing noise abatement for new development adjacent to the proposed DNT 4B/5A.

**Hazardous Materials**

In accordance with the American Society for Testing and Materials (ASTM) Standard Practice for Phase I Environmental Site Assessment (ASTM-1527-05), a state and federal regulatory database search was conducted to identify potential hazardous materials sites within the proposed DNT 4B/5A project area. This search identified potential hazardous/regulated materials sites and facilities located within 1 mile of either side of the proposed DNT 4B/5A. The database identified three sites at two locations. The identified sites consist of one Municipal Solid Waste Landfill (MSWLF) site (1.3 miles southwest of the CR 9/FM 455 intersection in Collin County, MSWLF was not constructed) and two Tier II Chemical Reporting Program Facility sites at one location (17099 Celina Road, Celina). None of these sites are considered to be a high risk for construction worker safety or ROW acquisition.

On October 12-14, 2010, a site reconnaissance was conducted throughout the proposed DNT 4B/5A project area in accordance with ASTM procedures. No Recognized Environmental Conditions were observed during the site reconnaissance. The identified potential hazardous/regulated materials sites are shown on **Exhibit 2-4**.

1 **Community Impacts**

2  
3 A Community Impact Assessment was conducted to identify the limits of the local community  
4 and provide an understanding of how the proposed project will impact, both positively and  
5 negatively, the local community. The assessment included research into the history of the local  
6 area, identification of local and regional population trends, and analysis of how traffic patterns,  
7 tolling, and other potential direct impacts could affect specific racial, ethnic and economic  
8 populations in the area. The Community Impact Assessment is provided in **Appendix 2-12** and  
9 summaries from the assessment are presented in the following sections.

10  
11 **Socioeconomics**

12 To determine potential social and economic effects on the community, Limited English  
13 Proficiency (LEP) populations, community cohesion, and potential displacements/relocations  
14 associated with the proposed DNT 4B/5A project area were identified. The elements discussed  
15 below were evaluated and supporting information is located in **Appendix 2-12**.

16  
17 ***Regional and Community Growth***

18 According to the *Census 2000*, the North Central Texas region added nearly 1.2 million  
19 residents since the 1990 census, accounting for nearly one-third of the total population growth in  
20 Texas. The regional and community growth in and around the cities of Celina and Gunter is  
21 expected to continue along present trends.

22  
23 ***Community Cohesion***

24 Although each county in the project area exhibits an agricultural community, no defined  
25 community based on shared agricultural experiences is present along the proposed DNT 4B/5A  
26 corridor. Many adjacent properties are owned by investors who have expressed an intent to  
27 donate a portion of their land to the NTTA for the proposed DNT 4B/5A ROW and to develop the  
28 remainder. The proposed alignment primarily follows the Denton/Collin county line until passing  
29 into Grayson County where it follows an existing roadway. The majority of adjacent properties  
30 would not be divided by the proposed DNT 4B/5A.

31  
32 Public meetings were held throughout the planning process to receive feedback from residents  
33 in the area. Based upon the comments received at the meetings, the residents of Celina, Pilot  
34 Point, and Gunter are generally in favor of the proposed DNT 4B/5A, and substantial support  
35 was expressed for the proposed DNT 4B/5A alignment as described in this EE. The primary  
36 reason stated by the residents for favoring this alignment is the potential economic benefit that  
37 would be realized by Collin, Denton, and Grayson counties.

38  
39 Impacts to community cohesion are not expected. Impacts to each county's agricultural  
40 community would occur on the periphery of each community because the proposed DNT 4B/5A  
41 is located along the county line. No distinct neighborhoods, ethnic groups, or other specific  
42 groups have been identified along the proposed DNT 4B/5A limits.

43  
44 Future benefits to community cohesion are anticipated because of potential employment  
45 opportunities, improved commercial, retail, and entertainment facilities, and an increase in tax  
46 revenue and real estate values.

1 **Limited English Proficiency**

2 In accordance with Title VI of the Civil Rights Restoration Act of 1987 and Executive Order  
3 13166, the NTTA has examined the services and planning processes associated with the  
4 proposed DNT 4B/5A to ensure that persons with LEP were not excluded or underserved during  
5 the project planning process. Public involvement thus far has included two public meetings held  
6 on March 9 and 11, 2010. Notices for the public meetings were published in area newspapers,  
7 including the widely-circulated Spanish publication, *Al Día*. The public meeting notice informed  
8 citizens of the opportunity to request an interpreter be present at the public meetings for  
9 language or other special communication needs. Such steps will continue to be taken  
10 throughout the public involvement process to ensure that LEP persons have meaningful access  
11 to the programs, services, and information that the NTTA provides.  
12

13 **Relocations and Displacements**

14 The proposed DNT 4B/5A would not require any single-family residential or business  
15 relocations. There are two S-curves present along the proposed DNT 4B/5A alignment: one at  
16 the southern end and one at the northern end. The S-curve in the southern portion of the  
17 project area allows the proposed DNT 4B/5A alignment to shift west from the planned northern  
18 terminus for DNT Phase 4A to follow the Denton/Collin county line. The northern S-curve was  
19 designed to avoid or limit impacts to important water features and reduce the number of affected  
20 property owners. Because of these shifts in the proposed DNT 4B/5A alignment, the number of  
21 potentially divided parcels is substantially less than if a direct north-south alignment was  
22 proposed. Additionally, this proposed DNT 4B/5A alignment eliminates all potential  
23 displacements and relocations.  
24

25 **Tollway Access**

26 Access to the mainlanes of the proposed DNT 4B/5A would be limited to those who either elect  
27 to or can only on occasional basis afford to pay the toll. The proposed DNT 4B/5A would be a  
28 limited-access facility.  
29

30 • Non-Toll Alternatives

31 Frontage roads with three lanes in each direction would be available along the entire  
32 length of the proposed alignment. Motorists utilizing these frontage roads may  
33 experience longer travel times than motorists using the tolled facility due to a lower  
34 posted speed limit and signalization.  
35

36 • Transit Usage

37 Operating the proposed DNT 4B/5A as an electronic toll collection facility is not expected  
38 to adversely affect transit usage because no mass transit system exists within the  
39 proposed DNT 4B/5A project area. The Dallas Area Rapid Transit (DART) system  
40 utilizes the existing DNT facility in the cities of Dallas, Farmers Branch, Carrollton, Plano  
41 and the Town of Addison. However, the cities of Celina and Gunter are not members of  
42 DART at this time.  
43

44 • Toll Rate

45 The toll rates for DNT 4B/5A would be consistent with other toll rates in the region. The  
46 exact toll rate for the proposed facility would be determined prior to the facility opening.

1  
2 • Methods of Toll Charge Collection

3 The NTTA proposes to incorporate an electronic toll collection system with ZipCash®  
4 along the DNT 4B/5A facility. The Dallas area TollTag® (transponder), TxTag® stickers,  
5 and the Houston area EZ TAG® (transponder) would be accepted on the proposed  
6 facility. Toll charges could be automatically deducted from a prepaid credit account or  
7 would be mailed as a monthly statement to the driver if the ZipCash® method is utilized.  
8 If the driver has a TollTag® or other toll transponder account, the tolls would  
9 automatically be deducted from the account when the facility is used. The account would  
10 be a prepaid account which means the driver must maintain sufficient funds to cover  
11 incurred toll charges, such as for accounts currently in use for existing toll roads.

12  
13 • Comparison of Payment Methods

14 Not maintaining a prepaid account would impact any user, including low-income users,  
15 because the cost of paying the accumulated toll charges without an account would  
16 represent a higher toll rate than toll charges affiliated with a prepaid account. Cash  
17 payment options are available for each payment method; however, only those users who  
18 maintain prepaid accounts would benefit from reduced toll rates. In summary, toll rates  
19 are one-third to one-half more for drivers who do not have an electronic toll transponder  
20 to offset the costs related to processing the license plate information associated with  
21 ZipCash®. Although certain toll transponder account holders are required to pay up-front  
22 fees or deposits for toll transponders (\$9.65 fee per transponder for TxTag® accounts  
23 and \$25 deposit for TollTag® “cash users” accounts), the toll transponder account  
24 holders would benefit from reduced toll rates compared to the total toll rates associated  
25 with ZipCash®.

26  
27 **Environmental Justice**

28 Based on the analysis provided in **Appendix 2-12**, no significant direct environmental justice  
29 effects would result from the proposed DNT 4B/5A. The 18 Census blocks that comprise the  
30 minority study area contain a total minority population of 12.2%. The three Census block groups  
31 that comprise the low-income study area contain a total low-income population of 6.3%. These  
32 populations are not present within the proposed DNT 4B/5A project area as readily identifiable  
33 groups, but are scattered throughout the project area. No defined communities are present  
34 within the environmental justice study area; however, Census data and field investigations  
35 reveal a homogenous rural population.

36  
37 Based on previous representations by many of the current property owners, much of the  
38 proposed ROW would be donated, and no displacements or relocations would be associated  
39 with the proposed DNT 4B/5A. Mitigation would be conducted for vegetation and water quality  
40 impacts. No air quality, noise, or hazardous materials impacts are expected. Benefits to local  
41 minority and low-income populations from the proposed DNT 4B/5A would include increased  
42 mobility, access to the region, transportation carrying capacity, and safety in the area.  
43 Additionally, the improved access to the area would enable new development leading to job  
44 growth, improved land values and better access to goods and services.

1 **Tolling Impacts**

2 To analyze “user impacts” of the proposed DNT 4B/5A extension on low-income and minority  
3 populations, origin-destination (O&D) data was requested from the NCTCOG. Studying O&D  
4 data can determine travel patterns of traffic along a transportation facility during a typical day.  
5 This form of analysis is useful in assessing user impacts because the number of trips  
6 associated with specific population characteristics can be analyzed to provide general travel  
7 assumptions of those specific populations. Trips are defined as a one-way movement from a  
8 starting point (origin) to an arrival point (destination).  
9

10 The O&D data obtained from the NCTCOG was not sufficient to analyze user impacts  
11 associated with the proposed DNT 4B/5A because of technical limitations and a lack of  
12 sufficient input data for the model. After population forecasts are determined based on *Census*  
13 *2010* data and an improved transportation network is available for the proposed DNT 4B/5A  
14 project area, an accurate O&D analysis could be conducted. However, this will not occur for at  
15 least two more years.  
16

17 **Indirect Impacts**

18 An indirect impacts analysis was conducted for the proposed DNT 4B/5A in accordance with  
19 TxDOT's seven-step analytical process<sup>9</sup> and guidance found in National Cooperative Highway  
20 Research Program Report 466 for assessing indirect impacts. Indirect impacts differ from the  
21 direct impacts associated with the construction and operation of the proposed DNT 4B/5A and  
22 are caused by other actions that have an established relationship or connection to the proposed  
23 DNT 4B/5A. These induced developments are those that would not or could not occur except for  
24 the implementation of the proposed DNT 4B/5A.  
25

26 The indirect impacts analysis considered the area of influence (AOI), or area in which the  
27 impacts of the DNT 4B/5A would be felt. Based on stakeholder input and historic development  
28 patterns, the AOI established for the proposed DNT 4B/5A extends north from FM 428 to  
29 FM 121 and 0.5 mile east and west of the proposed ROW. In certain areas the AOI extends  
30 beyond the 0.5-mile mark to include identified induced development. This area encompasses  
31 8,607 acres and is shown in **Exhibit 2-5**. This analysis concluded there would be substantial  
32 encroachment-alteration effects related to economic gains in the AOI, but they would not have  
33 an adverse effect on notable features in the AOI. Other substantial encroachment-alteration  
34 effects (e.g., habitat fragmentation and changes to local travel patterns) as a result of  
35 constructing the proposed DNT 4B/5A would not likely occur. Substantial induced urban  
36 development (i.e., 2,434 acres) in the cities of Celina and Gunter would be associated with the  
37 proposed DNT 4B/5A, which is illustrated for the AOI in **Exhibit 2-5**. This induced development  
38 would impact an estimated 2,305 acres of undeveloped land, fenceline vegetation, bottomland  
39 hardwoods, and wetlands along with 42,641 linear feet of streams. Mitigation would be the  
40 responsibility of the developer and specific mitigation would be determined when the  
41 development is planned. A full discussion of the indirect impacts analysis is in **Appendix 2-13**.  
42  
43

<sup>9</sup> TxDOT *Guidance on Preparing Indirect and Cumulative Impact Analyses* (June 2009);  
[http://www.txdot.gov/txdot\\_library/consultants\\_contractors/publications/environmental\\_resources.htm](http://www.txdot.gov/txdot_library/consultants_contractors/publications/environmental_resources.htm).

1 **Cumulative Impacts**

2 Federal Council on Environmental Quality regulations (40 Code of Federal Regulations 1508.7)  
3 define cumulative impacts (i.e., effects) as “the impact on the environment which results from  
4 the incremental impact of the proposed action when added to other past, present, and  
5 reasonably foreseeable future actions.” As this regulation suggests, the purpose of a cumulative  
6 impacts analysis is to view the direct and indirect impacts of the proposed DNT 4B/5A within  
7 larger contexts of time and space. An analysis of cumulative impacts was conducted following  
8 the eight steps outlined in TxDOT guidance,<sup>10</sup> which is designed to be consistent with controlling  
9 case law.<sup>11</sup>

10  
11 Cumulative impacts analysis considers cumulative impacts for resources that are expected to  
12 receive adverse direct and/or indirect impacts from the proposed project. For the proposed DNT  
13 4B/5A, this analysis evaluated cumulative impacts to waters of the U.S., vegetation and wildlife  
14 habitat, as well as air quality. The resource study areas (RSA) considered in this analysis are  
15 shown in **Exhibit 2-6** (vegetation/habitat and waters) and **Exhibit 2-7** (air quality). A summary of  
16 the individual and combined direct impacts, indirect effects, impacts from reasonably  
17 foreseeable projects, and cumulative impacts for the proposed DNT 4B/5A is provided in **Table**  
18 **2-5**. Cumulative impacts to vegetation and wildlife habitat would affect approximately 4% of  
19 habitat resources within the RSA and are not considered substantial. Cumulative impacts to  
20 streams and wetlands within the RSA would impact 4.8% and 1.7% of these resources,  
21 respectively, and are not considered substantial. The examination of air quality indicates that a  
22 net cumulative benefit to regional air quality is expected. A detailed discussion of the cumulative  
23 impacts analysis is included in **Appendix 2-14**.

<sup>10</sup> TxDOT *Guidance on Preparing Indirect and Cumulative Impact Analyses* (June 2009).

<sup>11</sup> See, for example, *Fritiofson v. Alexander*, 772 F.2d 1225, 5<sup>th</sup> Circuit, 1985.

1  
2

**Table 2-5. Summary of Resource Impacts**

Resource	Direct Impacts	Indirect Effects	Reasonably Foreseeable Projects	Cumulative Impacts
<b>Waters of the U.S.</b>	Approximately 19,345 linear feet of streams and 0.3 acre of wetlands	Approximately 42,641 linear feet of streams and 4 acres of wetlands	Approximately 0.15 acre of stream	Approximately 61,986 linear feet of streams, and 4.3 acres of wetlands
<b>Vegetation/ Wildlife Habitat</b>	Approximately 45 acres of riparian forests, 3 acres of fencerow trees, 549 acres of crops/pasture, 0.4 acre of native grasses, and 5 acres of upland forest	Approximately 2,297 acres of undeveloped land, including unmaintained herbaceous and crops/pasture	Approximately 0.2 acre of riparian forests, 0.68 acre of fencerow trees, 7.9 acres of crops / pasture, and 77.6 acres of maintained herbaceous vegetation	Approximately 2,986 acres of vegetation impacts
<b>Air Quality</b>	Minimal to no impacts.	No anticipated effects	Impacts from on-road mobile sources associated with transportation actions would not adversely affect the regional O <sub>3</sub> standard compliance or maintenance of the other air quality standards.	Any increased air pollutant or MSAT emissions resulting from increased capacity, accessibility and development are projected to be more than offset by emissions reductions from EPA new fuel and vehicle standards or addressed by EPA and TCEQ regulatory emissions limits programs. Projected traffic volumes are expected to result in no impacts on air quality; improved mobility and circulation may benefit air quality. Increases in urbanization would likely have a negative impact on air quality. However, planned transportation improvements within the project area as listed in a conforming MTP and TIP coupled with EPA vehicle and fuel regulations fleet turnover, are anticipated to have a cumulatively beneficial impact on air quality.

**Public Lands**

The proposed DNT 4B/5A would not require the use of or substantially impair the purposes of any publicly owned land from a public park, recreation area, wildlife/waterfowl refuge, or any historic sites of national, state, or local significance. Therefore, the requirements of Chapter 26 of the Texas Parks and Wildlife Code would not apply to this locally-funded proposed DNT 4B/5A.

1 **Other**

2  
3 **Local Tree Ordinances**

4 Municipal governments have the authority to avoid, minimize, and mitigate the impacts of  
5 private property development to habitat within their jurisdictions through the application of  
6 regulations that guide the intensity, type, and location of new development. The City of Celina  
7 has a tree preservation ordinance (as of December 2010) which defines protected tree species  
8 and requires mitigation for protected trees greater than 6 inches dbh.<sup>12</sup> The City of Gunter does  
9 not have a tree preservation ordinance, but prohibits the planting of undesirable trees and  
10 shrubs in its zoning ordinance.<sup>13</sup> The City of Pilot Point does not have an ordinance addressing  
11 tree preservation. Local ordinances and processes that regulate development and preserve  
12 natural resources will be followed as required.

13  
14  
15 **Airway-Highway Clearance**

16 Airway-highway clearance regulations do not apply to the proposed DNT 4B/5A because federal  
17 funding is not being utilized. There are no airports within the proposed DNT 4B/5A vicinity;  
18 therefore, coordination with local airports is not required.

19  
20 **Visual Quality and Aesthetics**

21 The visual landscape near the proposed DNT 4B/5A project area is characterized by primarily  
22 farmland, vacant land, and floodplains with a limited number of residences and farmsteads. The  
23 proposed DNT 4B/5A is in compliance with, and would facilitate, local development plans. The  
24 implementation of the NTTA's Design Guidelines for the proposed DNT 4B/5A would allow the  
25 user to experience system continuity, corridor identity, consistent and attractive gateways, a  
26 high quality driving experience, and enhanced safety along the corridor. In this regard, the  
27 proposed DNT 4B/5A would not result in a negative aesthetic impact for views of and from the  
28 road.

29  
30

## Summary of Impacts

Features of the proposed DNT 4B/5A and its potential impacts are summarized in **Table 2-6**.

**Table 2-6. Summary of Project Features and Impacts**

Comparison Factors	Unit of Measure	No-Build Alternative	Build Alternative
<b>Project Description</b>			
Total Length	miles	---	11.9
Total Proposed ROW	acres	---	583.5
Total Proposed Drainage Easements	acres	---	33.9
Estimated Cost (2011 dollars)	\$ (in millions)	---	677.8
<b>Water Resources</b>			
Waters of the U.S., Wetlands	acres	0	0.3
Waters of the U.S., Streams	acres	0	5.3
Navigable Waterways	acres	0	0
Impaired Waters	Y/N; if Y (acres)	N	N
Floodplains*	acres	0	71.8
<b>Biological Resources</b>			
Riparian Forest Habitat	acres	0	44.9
Upland Forest Habitat	acres	0	4.5
Fencerow Vegetation	acres	0	3.4
Large Trees	number	0	6
Native Prairie Habitat	acres	0	0.4
Ponds	acres	0	0.6
Total Wildlife Habitat	acres	0	53.8
Threatened or Endangered Species	Y/N	N	N
<b>Cultural Resources</b>			
NRHP-Eligible Historic-age Resources	number	0	0
Archeological Resources	number	0	0
<b>Physical Environment</b>			
MSAT Sensitive Receptors	number	0	0
MSAT Emissions	increase/decrease	decrease	decrease
Noise Receivers with Traffic Noise Impacts	number	0	0
High Risk Hazardous Materials Sites	number	0	0
<b>Community Impacts</b>			
Change in Community Cohesion	Y/N	N	Y
Residential Displacements	number	0	0
Commercial Displacements	number	0	0
Community and Public Facility Displacements	number	0	0
Environmental Justice Issues	Y/N	N	N
Public Lands	acres	0	0
Indirect Impacts	Y/N	N	Y
Cumulative Impacts	Y/N	N	Y

\* Floodplains are included as a descriptive feature, as no impacts are expected to floodplain hydraulic functioning.

- Storm Water
- Floodplains
- Vegetation and Wildlife
- Historic Resources
- Archeological Resources
- Traffic Noise
- Public Lands

10  
11  
12

1 **Permits**

2  
3 **Section 404 Permit**

4 Based on a preliminary jurisdictional determination, impacts at Crossing-6 and Crossing-9 would  
5 exceed the maximum allowable (0.5 acre) under Nationwide Permit (NWP) 14 – Linear  
6 Transportation Projects; therefore, an Individual Permit (IP) would be required. Because impacts  
7 at Crossing-1, Crossing-3, Crossing-4, Crossing-10 through Crossing-16, and Crossing-20  
8 through Crossing-22 exceed the 0.1 acre permanent impact threshold for NWP 14 and/or affect  
9 associated wetlands, a Pre-Construction Notification (PCN) would be required for these  
10 locations. NWP 14 without a PCN would be required for Crossing-2, Crossing-5, Crossing-7,  
11 Crossing-8, and Crossing-17 through Crossing-19 because permanent impacts are less than  
12 0.1 acre and no special aquatic sites (which include wetlands) would be impacted. Although  
13 NWP 14 is applicable for some of the crossings, the entire project would be submitted to the  
14 USACE for an IP as two of the crossings exceed the regulatory limits of NWP 14. This approach  
15 is consistent with the USACE-recommended procedure followed on similar projects, which  
16 ensures that impacts to waters of the U.S. requiring authorization by an IP can be viewed and  
17 justified in the context of the entire project. Additionally, it is expected that the USACE would  
18 exercise its discretionary authority to allow impacts under NWP 14 for the crossings that meet  
19 its criteria. Channelization would be required to construct the proposed DNT 4B/5A.  
20

21 **Section 401 Certification**

22 Permits under Section 404 of the CWA require applicants to also obtain the appropriate level of  
23 state water quality certification under Section 401 of the CWA. In Texas, compliance with  
24 Section 401 requires the use of the TCEQ's Best Management Practices (BMP) to manage  
25 water quality during construction. These BMP would address each of the following categories:  
26

- 27 • Category I Erosion Control would be addressed by applying temporary reseeding to  
28 disturbed areas.
- 29 • Category II Sedimentation Control would be addressed by installing rock berms and  
30 erosion control logs.
- 31 • Category III Post-Construction Total Suspended Solids control would be addressed by  
32 installing erosion control compost.  
33

34 Other approved BMP methods may be substituted if appropriate.  
35

36 Additional regulatory requirements will apply to Crossing-6 and Crossing-9, including completion  
37 of the TCEQ Tier II 401 Certification Questionnaire and Alternatives Analysis Checklist.  
38

39 **Section 402 TPDES Permit**

40 The proposed DNT 4B/5A will disturb more than 5 acres of land. As a result, the NTTA will be  
41 required to comply with the TCEQ Texas Pollutant Discharge Elimination System (TPDES)  
42 Construction General Permit (CGP) and file a Notice of Intent to obtain coverage under this  
43 general permit. In addition, a Storm Water Pollution Prevention Plan (SW3P) will need to be  
44 developed and implemented during construction. Impacts will be minimized by avoiding work by  
45 construction equipment directly in stream channels and/or adjacent areas. No permanent water  
46 quality impacts are expected as a result of the proposed DNT 4B/5A.

1 **Texas Antiquities Permit**

2 An archeological evaluation of archival records relevant to the proposed DNT 4B/5A project  
3 area recommended a field survey of the project corridor. After reviewing the archeological  
4 evaluation, the THC indicated that a pedestrian field survey would be required (see **Appendix**  
5 **5-1**). The NTTA submitted a TAP application on January 14, 2011 (see **Appendix 3-1**), and the  
6 THC issued TAP No. 5866 on January 25, 2011 (see **Appendix 5-1**). The archeological field  
7 survey was completed in April 2011 (**Appendix 2-8**), which found no archeological resources  
8 that would meet the eligibility criteria for listing on the NRHP. The results of the field survey will  
9 be coordinated with the THC and correspondence will be added to **Appendix 5-1**. No further  
10 actions under the TAP are anticipated.

11  
12 **Mitigation**

13  
14 **Waters of the U.S., Including Wetlands**

15 Avoidance and minimization of impacts to wetlands were considered in the design of the  
16 proposed DNT 4B/5A. Impacts to the emergent wetlands within the Little Elm Creek floodplain  
17 (i.e., Crossing-10, Crossing-11, Crossing-13, Crossing-14, and Crossing-15) are unavoidable  
18 because of local conditions and design requirements that preclude moving the alignment of the  
19 proposed Build Alternative. These wetlands occur on the bridge abutment or under the  
20 proposed bridge over Little Elm Creek. The proposed DNT 4B/5A at this location is situated  
21 between a flood control reservoir to the west and Little Elm Creek to the east. Moving the  
22 proposed DNT 4B/5A to the east would greatly increase impacts to Little Elm Creek, and  
23 moving it westward would result in impacts to the flood control reservoir impoundment.  
24 Consequently, there is no practicable alternative that would avoid impacts to these four  
25 wetlands. Specific mitigation requirements would be developed to address impacts to waters of  
26 the U.S., including wetlands, in connection with the Section 404 permitting process with  
27 USACE.

28  
29 To minimize impacts to water quality during construction, the proposed DNT 4B/5A would utilize  
30 temporary erosion and sedimentation control practices (i.e., temporary reseeding of disturbed  
31 areas, rock berms and erosion control logs, and/or erosion control compost). Where  
32 appropriate, these temporary erosion and sedimentation control structures would be in place  
33 prior to the initiation of construction and would be maintained throughout the construction  
34 period. Clearing of vegetation would be limited and/or phased to maintain a natural water quality  
35 buffer and minimize the amount of erodible earth exposed at any one time. Upon completion of  
36 earthwork operations, disturbed areas would be restored and reseeded.

37  
38 **Floodplains**

39 The project design has included nearly 34 acres of drainage easements to ensure the proposed  
40 DNT 4B/5A would accommodate the design year flood without damaging the tollway, stream, or  
41 other property. In particular, drainage easements associated with three bridge crossings of  
42 floodplains (i.e., Little Elm Creek, and two floodplains near the intersection of CR 8 and CR 9)  
43 were created to allow necessary grading of the floodplain to ensure no change in base flood  
44 elevations.

1 **Vegetation/Habitat**

2 During project development, the NTTA would design, use, and promote construction practices  
3 that minimize adverse effects on both regulated and unregulated wildlife habitat. Existing  
4 vegetation, especially native trees, would be avoided and preserved wherever practicable.  
5 Every effort would be made to preserve trees within the ROW and other areas where they  
6 neither compromise safety nor substantially interfere with construction of the proposed DNT  
7 4B/5A.

8  
9 In instances where habitat of particular value to wildlife would be affected by the proposed DNT  
10 4B/5A, the NTTA would coordinate with the TPWD for recommendations. Mitigation may be  
11 appropriate, under TPWD guidelines for transportation projects, for impacts to approximately 45  
12 acres of riparian forests. Additionally, several small patches of native tallgrass prairie totaling  
13 0.41 acre may warrant mitigation.

14  
15 **Traffic Noise**

16 Noise associated with the construction of the proposed DNT 4B/5A is difficult to predict. Heavy  
17 machinery, the major source of noise in construction, is constantly moving in unpredictable  
18 patterns. However, construction normally occurs during daylight hours when occasional loud  
19 noises are more tolerable. None of the noise receivers are expected to be exposed to  
20 construction noise for a long duration; therefore, any extended disruption of normal activities is  
21 not expected. Provisions would be included in the plans and specifications that require the  
22 contractor to make every reasonable effort to minimize construction noise through abatement  
23 measures such as work hour controls and proper maintenance of muffler systems.

**SECTION 4  
ENVIRONMENTAL COMPLIANCE**

**EPIC Categories**

- Waters of the U.S., Including Wetlands
- Storm Water
- Floodplain Development
- Vegetation
- Wildlife / Threatened and Endangered Species
- Cultural Resources
- Hazardous Materials
- Noise Abatement
- Public Lands

1 The Design Section Engineers shall ensure that all applicable environmental issues, permits,  
2 and commitments (EPIC) are included on the proposed DNT 4B/5A project EPIC sheet(s). EPIC  
3 sheet(s) shall be included in the final plans, specifications, and estimates prior to bidding. At the  
4 time of this EE, known EPIC are as follows:  
5

6 **EPIC Categories**  
7

8 **Waters of the U.S., Including Wetlands**

9 The EPIC sheet(s) shall convey to the Contractor the USACE Section 404 IP number and  
10 locations of any waters of the U.S., including wetlands, within the proposed DNT 4B/5A project  
11 area and direct the Contractor to be familiar with the permit and all of its conditions (general  
12 and/or special).  
13

14 **Storm Water**

15 The EPIC sheet(s) shall include BMP as required by current state and local regulations.  
16

17 **Vegetation**

18 The EPIC sheet(s) shall include:

- 19 • Instructions to avoid and/or preserve existing vegetation, especially native trees,  
20 wherever practicable;
- 21 • The location of sensitive habitat including riparian forest and native prairie remnant  
22 areas; and
- 23 • The location of any proposed mitigation areas for impacts to vegetation resources, if  
24 applicable.  
25

26 **Wildlife / Threatened and Endangered Species**

27 In accordance with the Migratory Bird Treaty Act, the Contractor will remove all old migratory  
28 bird nests from any structures that are affected by the proposed DNT 4B/5A and complete any  
29 bridge work and/or vegetation clearing between October 1 and February 15. The Contractor will  
30 be required to prevent migratory birds from building nests between February 15 and October 1.  
31 The EPIC sheet(s) shall state that a migratory bird survey will be conducted prior to the  
32 commencement of any construction, demolition, or clearing activities scheduled to occur during  
33 the nesting season between February 15 and October 1.  
34

35 In the event that migratory birds are encountered on-site during project construction, adverse  
36 impacts on protected birds, active nests, eggs, and/or young will be avoided. If species are  
37 present, work will cease at that location and NTTA personnel should be contacted. If any active  
38 nests are found, the local USFWS biologist will be contacted by the NTTA to determine an  
39 appropriate plan of action.  
40

41 The EPIC sheet(s) shall include the following regarding threatened and endangered species:

- 42 • The state-listed threatened timber/canebrake rattlesnake and its habitat description;
- 43 • Instructions to survey appropriate habitat areas (Little Elm Creek floodplain) for signs  
44 of the timber/canebrake rattlesnake prior to construction activities; and

- Instructions to notify the NTTA Environmental Compliance Manager if this species or any other federal and/or state-listed threatened and/or endangered species are encountered during construction activities.

**Cultural Resources**

The EPIC sheet(s) shall require the Contractor to notify the NTTA Environmental Compliance Manager if any previously undiscovered artifacts are encountered. At the time of this approval, there were no known historic-age resources (built prior to 1978) or archeological resources within the proposed DNT 4B/5A project APE.

In the event that unanticipated archeological deposits are encountered during construction, work in the immediate area will cease, and the NTTA's environmental compliance and archeological technical consultants will be contacted to initiate post review discovery procedures which include notifying the Archeology Division of the THC.

**Hazardous Materials**

The Contractor shall take appropriate measures to prevent, minimize, and control the spill of hazardous materials in the construction staging area. The use of construction equipment within environmentally sensitive areas such as streams or wetlands shall be minimized or eliminated entirely. All construction materials used for this project shall be removed as soon as the work schedules permit. Any unanticipated hazardous materials and/or petroleum contamination encountered during construction shall be handled according to applicable federal, state, and local regulations. The EPIC sheet(s) shall require the Contractor to notify the NTTA Environmental Compliance Manager if any undocumented regulated material is encountered.

**Noise Abatement**

The EPIC sheet(s) shall include a requirement for the contractor to make every reasonable effort to minimize construction noise through abatement measures such as work hour controls and proper maintenance of muffler systems.

**Local**

- NCTCOG
- City
- County
- DART
- The T
- Denton County Transit Authority

**Other**

- Other

1 **Federal**

2  
3 **USACE**

4 Coordination with the USACE will be required for anticipated impacts to jurisdictional waters of  
5 the U.S., including wetlands, and receipt of a Section 404 IP, prior to construction. Coordination  
6 with the USACE has not been initiated to date but will be added to **Appendix 5-1** as it occurs.

7  
8 **State**

9  
10 **TCEQ**

11 Coordination with the TCEQ would be required in order for the proposed DNT 4B/5A to comply  
12 with the TPDES CGP and SW3P regulations. In addition, coordination with the TCEQ will also  
13 be required for the proposed DNT 4B/5A to be in compliance with the CWA Section 401 water  
14 quality certification requirements. Coordination with the TCEQ has not been initiated to date but  
15 will be added to **Appendix 5-1** as it occurs.

16  
17 **TPWD**

18 Coordination with the TPWD was initiated to confirm the presence or absence of state listed  
19 threatened and endangered species within Collin, Denton, and Grayson counties as well as to  
20 obtain the TXNDD information for the proposed DNT 4B/5A project area and its vicinity. The  
21 data received from the TPWD is discussed in **Appendix 2-5**. Coordination with the TPWD  
22 regarding potential impacts to vegetation and wildlife habitat was initiated with the TPWD in  
23 March 2011. All correspondence with the TPWD is included in **Appendix 5-1** and will be  
24 updated as additional coordination occurs.

25  
26 **THC/SHPO**

27 Coordination with the THC/SHPO will occur, as necessary, throughout the DNT 4B/5A project  
28 planning process to determine if the project would affect any previously recorded historic and/or  
29 archeological resources as well as to provide information about field studies of cultural  
30 resources. A copy of the historic-age resources due diligence report (**Appendix 2-6**) was  
31 provided to the THC on March 3, 2011 (see **Appendix 5-1**). As a result of coordination with the  
32 THC/SHPO regarding the archeological evaluation of archival records (**Appendix 2-7**), the THC  
33 requested the completion of an archeological pedestrian survey of the proposed DNT 4B/5A  
34 project area. The archeological survey (**Appendix 2-8**) was completed in April 2011 and  
35 coordination with the THC is pending. All correspondence with the THC is included in **Appendix**  
36 **5-1** and will be updated as additional coordination occurs.

37  
38 **Local**

39  
40 **NCTCOG**

41 Early project coordination was made with the NCTCOG to obtain modeling data necessary to  
42 complete an analysis of MSAT emissions and potential impacts of tolling on environmental  
43 justice. The NTTA request for this information dated July 30, 2010 and the NCTCOG response  
44 dated November 19, 2010 are included in **Appendix 5-1**.

1 **City**

2 City officials have been involved as stakeholders throughout the development of the proposed  
3 DNT 4B/5A (see **Section 1, Alternatives Analysis**, and **Appendix 1-1**). The city councils of  
4 Gunter and Pilot Point have passed resolutions endorsing the proposed DNT 4B/5A alignment  
5 as their preferred alternative (see **Appendix 5-2**).

6  
7 Coordination with the City of Celina regarding its tree preservation ordinance will occur, as  
8 needed.

9  
10 Coordination with the cities of Celina, Gunter, and Pilot Point regarding the traffic noise analysis  
11 will occur to ensure that traffic noise contours are considered in zoning plans and future  
12 developments to avoid or minimize the need for noise abatement measures.

13  
14 **County**  
15 County government officials have assisted throughout the development of the proposed DNT  
16 4B/5A (see **Section 1, Alternatives Analysis**, and **Appendix 1-1**). Resolutions passed by  
17 Collin, Denton, and Grayson counties regarding the proposed DNT 4B/5A have been included in  
18 **Appendix 5-2**.

**SECTION 6  
PROJECT AGREEMENTS**

1  
2  
3  
4  
5

**Types of Agreements**

- Interlocal Agreement
- Memorandum of Understanding
- Letter of Intent
- Two-Party Agreement
- Three-Party Agreement
- Multi-Party Agreement

6  
7  
8  
9

1 **Types of Agreements**

2

3 **Interlocal Agreement**

4 It is expected that the NTTA will enter into an Interlocal Agreement (ILA) with cities and counties  
5 affected by the proposed ROW. This ILA would address the responsibility of local governments  
6 for actions that may include the acquisition of ROW, the construction of frontage roads, and  
7 relocation of utilities. The ILA would be expected to require the NTTA to evaluate the revenue  
8 feasibility of the proposed DNT 4B/5A and to construct the facility if, where, and when it  
9 determines that a toll facility would be cost effective.

10

11 **Memorandum of Understanding**

12 It is anticipated that a Memorandum of Understanding (MOU) may be negotiated with the cities  
13 of Celina, Gunter, and Pilot Point to more precisely define the role of each city in planning for  
14 and assisting with the construction of the proposed DNT 4B/5A under the ILA discussed above.  
15 It is not anticipated that any MOU will be negotiated until after the NTTA Board takes action on  
16 the project schematic design and this EE.
